

Hello, this file is a bash script that can back up any Linux system and perform security checks.

For the first input type either exit, back up or security

If back up it will ask what system you have

You either type arch debian ubuntu or other

If it is an arch based system it will give you 3 methods to back up so type 1 2 or 3 each with different methods.

After that it will exit

If you typed exit it will exit

If you typed security then it will run security checks then exit

That is it, thank you for using and looking at my bash script. Have a great day :).
